1. Introduction

1.1 Protocol Overview

Inspiration and Core Concept

This system was designed to **unify MQTT and ESP-NOW paradigms**, creating a transparent communication layer where:

ESP-NOW acts as "Wireless MQTT": Messages are routed using topic patterns (source/destination/action), simulating MQTT's publish/subscribe model without requiring a central broker.

Thislibrary includes implemented methods to **update using OTA protocol** (over the air) **using ESP-NOW**.

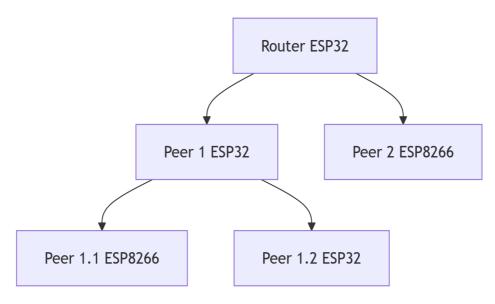

Full Abstraction: Developers interact with a single API while the library automatically chooses between:

ESP-NOW: For local peer-to-peer communication (ESP32/ESP8266)

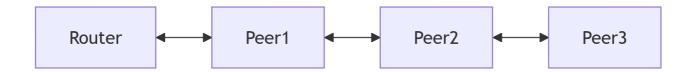

MQTT: For cloud/remote connectivity (ESP32 Router only)

A hybrid communication system combining:

- ESP-NOW for direct device-to-device messaging
- MQTT for cloud/remote communication
- Unified API for seamless protocol switching
- Hierarchical Tree:

· Linear Chain:

1.2 Key Features

Feature Description

Dual-Mode Operation Automatic ESP-NOW/MQTT

selection

Event-Driven Critical network event callbacks

Architecture Officer Hetwork event cambacks

Multi-Hop Routing Message forwarding through peers

Cross-Platform Support ESP32 (Router/Peer), ESP8266

(Peer)

1.3 Use Cases

· Industrial sensor networks

- Smart home automation
- · Agricultural monitoring systems

2. API Reference

2.1 Core Classes

MqttEspNowRouter (ESP32 Only)

```
cpp
```

EspNowPeer

```
срр
```

2.2 Data Structures

```
cpp
```

```
struct DeviceInfo {
   String name;
   uint8_t mac[6]; // MAC address in byte array format
   bool online = false;
   unsigned long lastPing = 0;
};
```

3. Code Examples

3.1 Router Initialization

```
срр
```

```
/* File: examples/Router/RouterBasic.ino */
#include <MqttEspNowRouter.h>
// Network configuration
const uint8 t routerMac[] = \{0x12,0x34,0x56,0x78,0x9A,0xBC\};
std::vector<DeviceInfo> peers = {{"Sensor1", {0xAA,0xBB,0xCC,0xDD,0xEE,0xFF}}};
MqttEspNowRouter router;
wifiConnManager wifi;
void setup() {
  wifi.onWifiReady([]() {
    wifi.onEspNowReady([]() {
      router.begin(6, 6, "MainRouter", routerMac,
                   "CloudBroker", peers, "mqtt.server.com", 1883);
      router.subscribe("CloudBroker", "Sensor1", "LED",
                       [](String msg) { /* Handler */ }, ROUTE MQTT);
    });
  });
  wifi.begin(/* ... parameters ... */);
```

3.2 Peer Implementation

```
срр
```

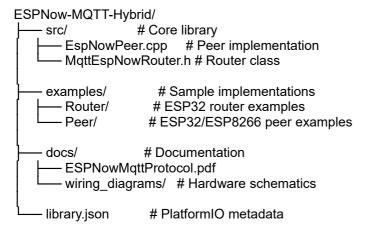

```
/* File: examples/Peer/PeerBasic.ino */
#include <EspNowPeer.h>

EspNowPeer peer;
std::vector<DeviceInfo> routers = {{"MainRouter",
{0x12,0x34,0x56,0x78,0x9A,0xBC}};

void setup() {
  peer.begin(6, "TempSensorl", routers, {});
```

4. Project Structure

Directory Layout

5. Platform Compatibility

Hardware Support

Feature	ESP32 Router	ESP32 Peer	ESP8266 Peer
MQTT Client	$ \checkmark $	×	×
ESP-NOW Transmitter	∜	⋞	⋞
Dual Protocol Routing	⋞	⋞	Limited

- Software Requirements
 - PlatformIO Core 6.1+
 - Arduino Framework 3.0+
 - ESP32 Arduino Core 2.0.9+

6. Key Event Sequence

Initialization Flow

- 1. WiFi Connection Establishment
- 2. ESP-NOW Protocol Initialization
- 3. MQTT Broker Connection (Router Only)
- 4. Peer/Router Registration
- 5. Message Handler Setup

Event Timeline

[0ms] WiFi.begin() [1200ms] onWifiReady() [1500ms] esp_now_init() [1600ms] onEspNowReady() [1700ms] MQTT.connect() [2000ms] Ready for Operation

7. Troubleshooting

Common Issues

Error Code	Description	Solution
0x3001	ESP-NOW Not Initialized	Check WiFi channel
0x102	MQTT Connection Failed	Verify broker credentials
N/A Debugging	Message Loss Tips	Verify MAC addresses
срр		
// Enable verb #define COM	ose logging M_DEBUG 1 // 0-Disable, 1-B	asic, 2-Verbose
// In setup():		

8. Revision History

Serial.setDebugOutput(true);

Versio n	Date	Changes
') 1	2024-03- 15	Added event API
2.0.2	2024-02- 28	ESP8266 fixes
1.4.1	2023-12- 10	Initial release
